Bandwidth extension of signal is defined as the deliberate process of expanding the frequency range of a signal in which it contains an appreciable and useful content, and/or the frequency range in which its effects are such. Its significant advancement in recent years has led to the technology being adopted commercially in several areas including psychacoustic bass enhancement of small loudspeakers and the high frequency enhancement of coded speech and audio. In this paper, a new method for blind bandwidth extension of WB audio signals is proposed based on non-linear prediction and hidden Markov model (HMM). The high-frequency (HF) components in the band of 7-14 kHz are artificially restored only from the low-frequency information of the WB audio. Blind bandwidth extension of audio signals based on non ... ity speech audio from a constrained conditioning representation, we extend this technology is to the problem of bandwidth extension (BWE) [5] for speech, also known as audio super-resolution [6].
