Catalog Of Lithic Fragments In Lithic fragments, or lithics, are pieces of other rocks that have been eroded down to sand size and now are sand grains in a sedimentary rock. They were first described and named (in their modern definitions) by Bill Dickinson in 1970. Lithic fragments can be derived from sedimentary, igneous or metamorphic rocks. A lithic fragment is defined using the Gazzi-Dickinson point-counting method and ... NASA/ADS Chert is by far the most abundant lithic fragment preserved in the Tantalus formation, making up 77% of the framework of the conglomerate and 56% of the sandstone. This is in marked contrast with the underlying Tanglefoot formation, in which only 16% of the framework grains in conglomerates and 5.5% in sandstones consist of chert. Lithic Fragment - an overview | ScienceDirect Topics Lithic fragments are much softer and chemically more reactive than their quartz-feldspar counterparts during burial diagenesis. Sedimentary fragments : Sedimentary lithics are typically mudrock, siltstone, argillite and greywacke (keep in mind that mudstone is a mix of clay- and silt-sized particles). The mineralogy of

sandstones: lithic fragments ... Rock fragments (also called lithic fragments or composite grains) can be derived from a wide variety of lithotypes and commonly have source-specific textures and compositions that can be recognized in thin section. Because of their multicrystalline/granular nature, rock fragments tend to be more common in the coarser grain-size modes of clastic ... Grains: Rock Fragments (Lithic Fragments) and lithic fragments welded together by a small amount of glass (Fig. 2). Angular grains of both shocked and unshocked plagioclase dominate the mineral fragment population. Mafic minerals, Fe-metal, troilite and ilmenite clasts are much less common. Lithic fragments include

granoblastic anorthosite and noritic anorthosite (up to ~3 mm), basaltic Apollo 16 Lunar Sample Catalog Part 1 - NASA Lithic arenites can be further subdivided according to the nature of the rock fragments, as shown in the smaller triangle of Figure 4. This classification scheme also recognizes three major types of wackes or graywackes that are roughly analogous with the three major arenite groups: quartz wacke , feldspathic wacke (with the subvariety arkosic ... From the Cambridge English Corpus In general, these sandstones are poorly sorted matrix-supported quartz wackes with framework grains of detrital quartz, lithic fragments, feldspar and

pyroxene. From the Cambridge English Corpus lithic fragment | Example sentences fragments with some mare basalt fragments (especially pyroxene-phyric). While it contains green glass as clods and impact glasses, mature regolith components such as agglutinates are rare to absent, and the clast size is much larger than for mature regoliths (Fig. 1). The finest matrix appears to be glass and tiny mineral and lithic fragments.
