Digital signals for transmission over a given medium are prepared from the outputs of an information source, which may produce signals in either analog or digital form. An analog information bearing waveform is sampled at an

appropriate sampling rate and then encoded into digital signal. Digital transmission is quite
different from analog transmission.
For one thing, the signal is much
simpler. Rather than being a
continuously variable wave form, it
is a series of discrete pulses,

representing one bits and zero bits
(see Figure 2.10). Analog and

Principles of television systems: A
television system involves
equipment located at the source of
production, equipment located in

the home of the viewer, and equipment used to convey the television signal from the producer to the viewer. The purpose of all of this equipment, as stated in the introduction to this article, is to extend the human senses of vision and ... Television - Principles of television systems | Britannica The digital telecommunications network had its origins with the development of pulse code modulation (PCM), invented by Reeves in 1937 and patented in 1939. As described in Chapter 3, PCM involves sampling, quantizing, and coding the analog telephone voice signal to produce a compressed binary digital signal.
